Loading a Boundary Map

The following steps will help you load a Boundary map that was previously created in the proper file format. (see Building maps for X30 power-point in the Service and Parts section of the Bourgault web site in the Monitor Training folder)

- A Boundary Map must be a shape file. As long as it is in the correct file format it can be preloaded into the X30 for use when the Field is loaded during seeding.

All of the maps require the folders in the following format

Create folders in the following format paying close attention to the lower case and capital letters.

- **Clients** – this is the primary folder that contains all of the other folders
 - **Client names** – You can create as many different clients as wish.
 - **Farm names** – Within each Client name you can have as many farm names as you wish.
 - **Field names** – Within Farm name you can have various field names.
 - **Boundaries**
 - **.shp shape files**
 - **Jobs**
 - **VRC**

The following pages outline how to transfer files to the hard drive of the X30 as long as the files are in the correct format.

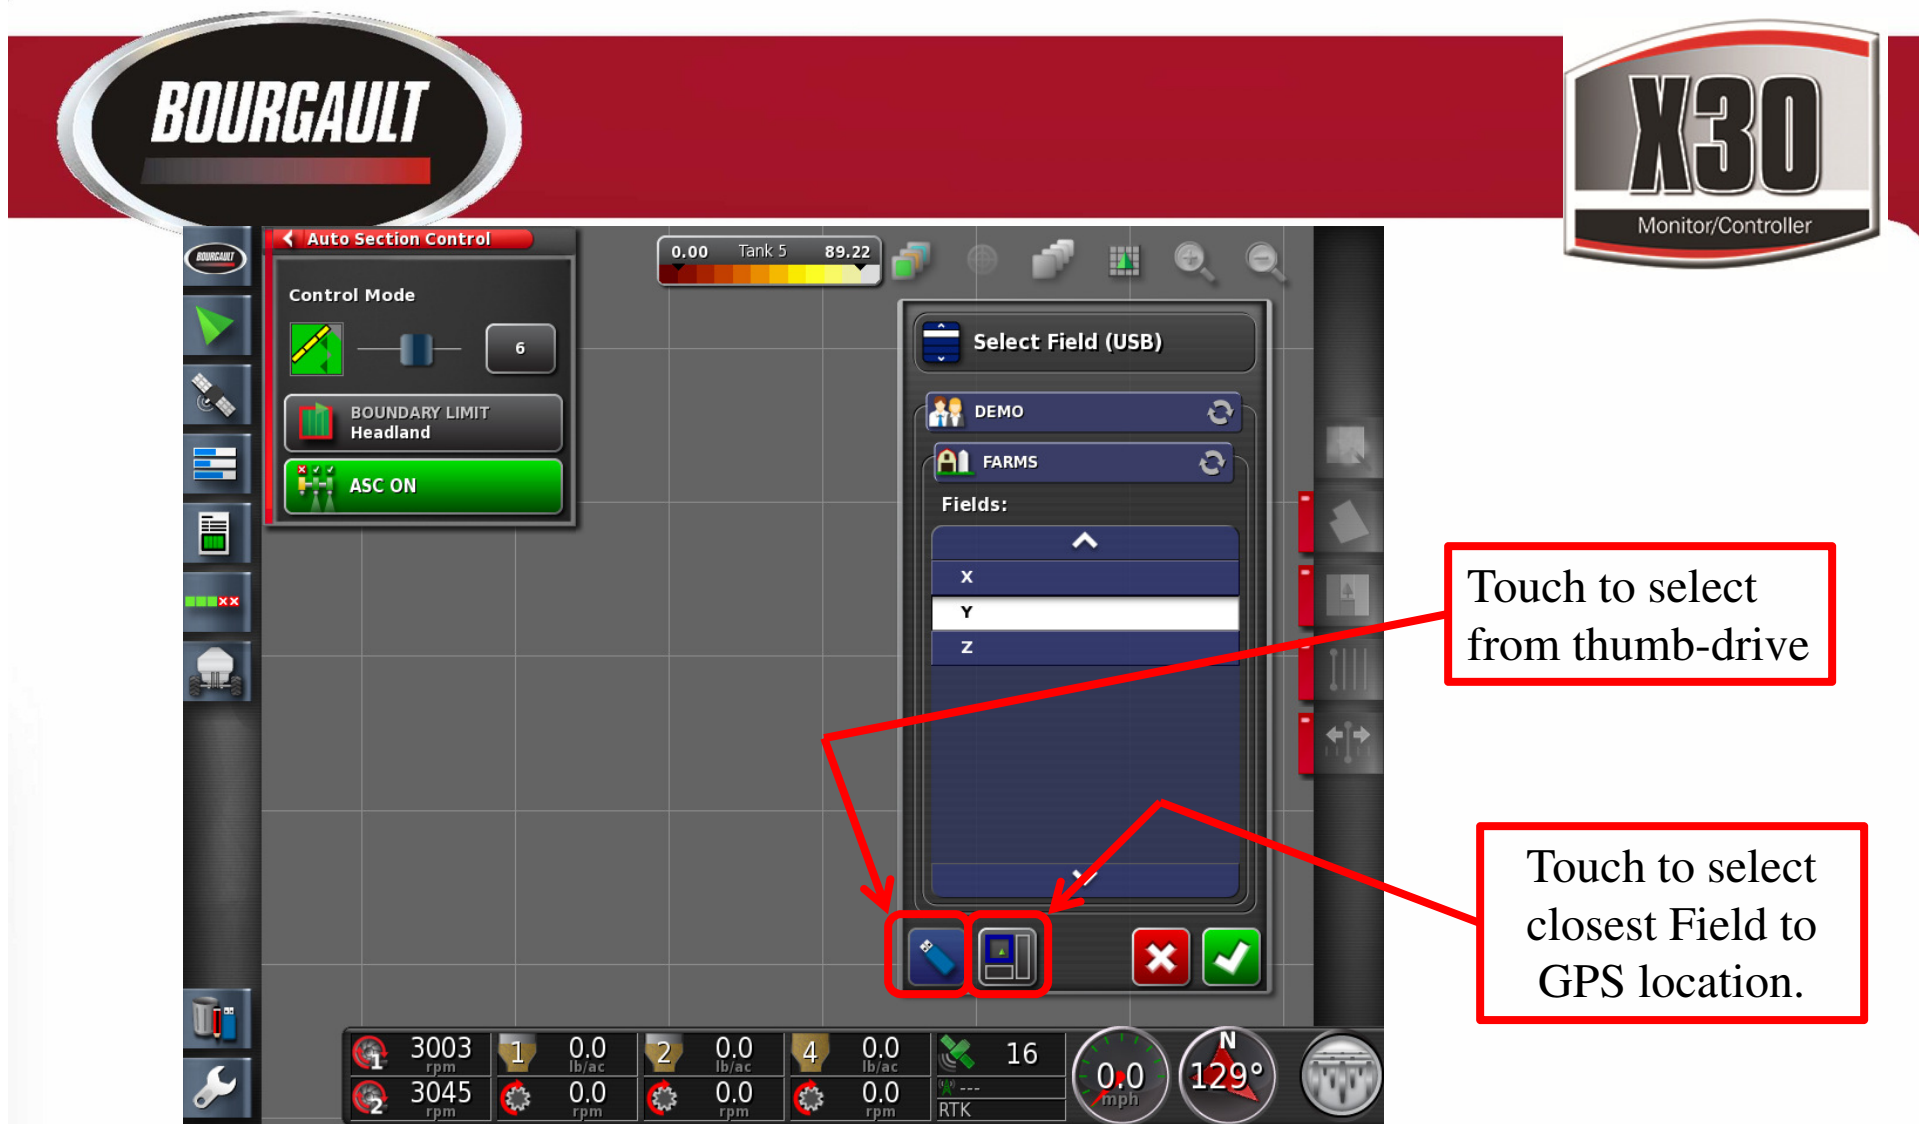

To load a Boundary map you must select a Field and start a Job

This tab lets you select a field from the X30 or thumb-drive.

This tab lets you create a new Field name.

Follow the prompts and select a Field from the X30, thumb-drive (as shown above) or select the closest Field
